

ClickScanner

Get more value out of your scans!

Scan systems and multifunctional systems usually produce TIF- or PDF-Files. Doing so in most cases each page is saved as a file or the entire batch is saved as one file.

As long as single pages or single documents are scanned this functionality is quite sufficient.

With increasing requirements such as batch processing, searchable files or automatic processing there are additional functions needed to increase the production efficiency significantly.

Barcode-Recognition

All common 1D and 2D barcodes are recognized right up to the industrial standard PDF417, no matter where the barcode is placed.

Empty page recognition

Empty pages can be found in two different ways: either by the number of pixels or by the number of characters on a page. ClickScanner can handle both ways, it is just a setting.

Empty page extraction

In most cases there is no sense in saving empty pages (which quite often occurs). ClickScanner can monitor empty pages and simply eliminate them if you want to. That simply saves disc space.

The solution: ClickScanner

ClickScanner focuses on automatic processing and offers a large variety of settings and functionality:

Automatic document separation

Scanning batches of documents an automatic document separation is mandatory to keep up efficiency. To this ClickScanner offers you different settings: separation by empty sheets, by barcode on the first page of each document or by a defined keyword such as serial stamp on the first page of each document.

**One Click Solutions:
We really want you to get through
your work faster.**

PDF/A generation

Additionally all processed files can be transformed into PDF/A format. Thus it is easily possible to find terms and text sequences in multipage files.

Full text extraction

But ClickScanner cannot only create searchable files, on top ClickScanner can extract the recognized full text in a separate file which then can be handed over to any back office system, e.g. archive systems or ERP systems.

Page rotation

Scanning a batch of documents it sometimes happens that some pages are not well oriented. It is almost impossible to efficiently handle those situations manually. But don't worry ClickScanners handles those situations automatically without any setting.

Automatic processing

To increase productivity ClickScanner can run as a service in the background that processes the contents of a hotfolder. That saves time because nobody has to assist the process manually. When ClickScanner has finished the batch it simply sends an Email to the operator.

Automatic file name generation (keyword, date/time, barcode)

ClickScanner can change the processed file names in two different ways: either it can add the contents of a recognized barcode to the given file name or, via the settings, you can add a document type to the file name of a batch e.g. "invoice". Thus you can simply categorize the files in document types.

Making more out of your scans!
