

# AutoClick for windream

## Automatic and efficient indexing of documents!

Documents in ECM-systems (**E**nterprise **C**ontent **M**anagement) need catchwords, so called indexes, to find them fast and safe.

To come to an efficient indexing, particularly when processing large numbers of documents such as invoices or delivery notes, a clever and flexible automated process is needed. Manual typing is far too time consuming and therefore too expensive.

Now, with **AutoClick**, a learning software solution is available for the ECM system windream. With AutoClick indexing of the captured documents is fast and easy.

pages will be analyzed by OCR and full text will be extracted for all documents. The full text file, all indexes and the scanned document will be handed over to windream so that you can search for almost any text in a document in windream.

### How it works:

**AutoClick** processes batches of scanned or copied images (documents) from local or network directories (with individual processing settings for each directory). In the first step scans will be orientated and adjusted, empty pages will be erased and single pages put together to multipage documents. Then all

In the next step the capturing of the indexes for the different document types in windream will take place. By the way: the different document types and their indexes are initially downloaded from windream which is done almost automatically; so you can be sure windream and **AutoClick** are fully synchronized! Before starting the automatic capturing you train the different suppliers, document types and their indexes, only once, very fast and very easy.

It takes only a minute to train a document!  
Without software know how or programming  
knowledge. For sure!

From then on **AutoClick** processes batches of  
scanned documents und extracts all indexes. If

**One Click Solutions:**  
**We really do want you to get through**  
**your work faster.**

something is missing, e.g. the supplier is new  
and not yet trained, it will be listed in a result  
table. Just train them and continue! Sure you  
can also manually type any index if you want.

**All** completely captured documents can be  
immediately automatically handed over to  
windream. The remaining documents can be  
manually completed or cleared. It's easy, isn't  
it?

**Sure, AutoClick** can also read barcodes,  
produce PDF/A documents and capture even  
line items.

You can integrate lookup data tables and verify  
captured indexes or specify rules for an index.  
And you can run **AutoClick** as a service in the  
background.

### **Windream workflow in use?**

No problem: having done its work AutoClick  
just starts windream workflow with a link to the  
captured document in the virtual file system of  
windream. To configure this you just have to  
make one adjustment in the configuration of  
AutoClick. Simple!

With **AutoClick for windream** One Click  
Solutions offers a very efficient solution to  
index documents automatically and significantly  
simple and flexible. On top, AutoClick is  
precisely synchronized with the ECM system  
windream.
